ATyS
Motorised and automatic changeover switches from 125 to 3200 A
A totally safe transfer, whatever the application

The design of the products in the ATyS family, based on proven load break switch technology, guarantees both the continuity of the power supply and the safety of operators. Its stable positions allow energy consumption to be minimised whilst ensuring maximum immunity to electrical network disturbances, making this a truly robust and reliable solution.

Ensures availability of the electrical power supply under all circumstances

The functions and design of the ATyS product range all work towards one key objective: ensuring the supply of loads downstream, via rapid transfer from one source to another. These products have three operating modes, which increase the ability to select the most reliable source under all circumstances. The products only require a power supply when changing position, which increases their reliability and service life.

Simplicity ensures safety

Thanks to their on-load switching capacity, coupled with their Auto and Manual operating modes, the ATyS are simple to use and 100% secure. The selection of the power supply source to the load can be achieved in three different ways:

- using the front operation handle (Manual mode),
- remotely, using the input for position control commands (Auto mode),
- automatically, depending on the availability of sources (Auto mode).

To ensure technical interventions downstream of the product are as secure as possible, ATyS have a high-performance padlocking function which is an efficient addition to the breaking functions.

ATyS family

A complete range of changeover switches, from 125 to 3200 A, adapted to all your applications

Five product versions are available, ensuring a solution suited to your application.

Automatic version (ATS) or motorised version (RTS)?

The ATyS t, ATyS g and ATyS p (ATS) versions differ from the ATyS and ATyS d in that they integrate an automatic controller. This means that the products themselves monitor the availability of sources, start the generators if necessary and automatically switch to the available source.

Conversely, ATyS and ATyS d (RTS) require an external controller to provide them with switching commands.
**Benefits of the ATyS range**

**Plug and play solution**

**Integrated auto-configuration**
As standard, all automatic versions have the auto-configuration function which enables **automatic setting of the nominal voltages and frequencies** for the network. Simply cable the product, which will then measure the values and record them.

**Quick installation**
All ATyS products are factory assembled and require minimum cabling, thereby simplifying the installation and reducing the amount of time required to be operational. For ATyS t and ATyS g, configuration adjustment is achieved via potentiometers, **requiring only a screwdriver and a few minutes**.

**Manual emergency control**
In the event of an emergency, it can be controlled **quickly, easily and safely** using an emergency handle. This handle is very easy to fit and no motorised or automatic transfer can take place when the handle is in place.

**Continuous information on product availability**
Products in the ATyS range are equipped with a Watchdog relay which **constantly monitors** your product, thereby securing your installation. This relay informs you of the capacity of your product to switch correctly following an electrical or automatic order.

**Robust products**
All ATyS product versions are designed and tested in accordance with standard IEC 60947-6-1, the benchmark for changeover switches offering optimum design and operating features.

**Improved performance**
According to IEC 60947-6-1:
- AC 33-B up to 1250 A
- AC 32-B up to 2000 A
- AC 31-B up to 3200 A

**Specific genset functions**
ATyS g and ATyS p can be utilised for switching between transformer and generator power supply sources. They have a genset run command and integrate **on load and off load test** functions. These functions ensure there is a good connection between the source changeover switch and the generator, and that these are both operating correctly. The ATyS p also allows **scheduled starts** to be programmed for these different tests.
The benefits of ATyS p

Simple configuration software: Easyconfig

The Easyconfig software is ideal for reducing the time spent during complex configuration operations. It allows the following parameters to be configured:
- type of application,
- voltage and frequency thresholds,
- timer values,
- inputs/outputs.

Communication options which make the difference: Modbus, Ethernet and Webserver

Thanks to optional modules, ATyS p communicate using Modbus and Ethernet protocols. The Ethernet communication module also integrates the Webserver function, allowing the ATyS p to be accessed via a web browser.

The Webserver function enables:
- product status display (product position and source status),
- the display of voltage measurements,
- the display of configured parameters,
- access to the event log.

Additions to the range

ATyS S and ATyS Sd
Motorised changeover switches from 40 to 125 A
Specially developed for manufacturers of small generators, ATyS S and Sd enable simultaneous breaking and switching between two power supply sources up to 125 A (< 90 kVA).

ATyS M
modular changeover switches from 40 to 160 A
Three versions of ATyS M (remote-controlled and automatic) are available to meet the vast majority of your source switching application requirements.
